

# Water Engineering and Management through Time: Learning from History

Water Engineering and Management - Learning from History explores the pair technology / water use (an indivisible pair, since the first member of the binomial determines the second) which, in the light of the knowledge available in the 21st century and with a conception focused on the near future, goes beyond the limits set by nature itself. The history of water reviewed in the context of this Seminar will help understand the importance water has had in every possible context and civilization in the past, an understanding that will undoubtedly lead to appreciate the true value of the most highly prized among natural resources. For the ultimate goal of the Seminar and the resulting book is to learn from history, approaching the problem from a pragmatic point of view, far from the political and social interests which, unfortunately, are usually linked to water. This work will be of particular interest to water managers, politicians, decision makers, and scientists and professionals working in the area of water sciences.
