

# School Chemistry Laboratory Safety Guide

In 1984, the Council of State Science Supervisors, in association with the U.S. Consumer Product Safety Commission and the National Institute for Occupational Safety and Health, published the safety guide *School Science Laboratories: A Guide to Some Hazardous Substances* to help science teachers identify hazardous substances that may be used in school laboratories and provide an inventory of these substances. Because school science curricula have changed since then, the safety guide has been updated and revised to reflect those changes. This guide on safety in the chemistry laboratory was also written to provide high school chemistry teachers with an easy-to-read reference to create a safe learning environment in the laboratory for their students. The document attempts to provide teachers, and ultimately their students, with information so that they can take the appropriate precautionary actions in order to prevent or minimize hazards, harmful exposures, and injuries in the laboratory. The guide presents information about ordering, using, storing, and maintaining chemicals in the high school laboratory. The guide also provides information about chemical waste, safety and emergency equipment, assessing chemical hazards, common safety symbols and signs, and fundamental resources relating to chemical safety, such as Material Safety Data Sheets and Chemical Hygiene Plans, to help create a safe environment for learning. In addition, checklists are provided for both teachers and students that highlight important information for working in the laboratory and identify hazards and safe work procedures. This guide is not intended to address all safety issues, but rather to provide basic information about important components of safety in the chemistry laboratory and to serve as a resource to locate further information.
